

Why Master The Command Line

More Control Over Your Machine!

Mastering the command line gives you far greater control over your machine. You can run commands to change permissions, view hidden files, interact with databases, start servers, manage processes, etc.

It's Faster*

Once you learn the basic commands and commit them to memory, you can perform tasks much faster than you could using a GUI. There is a bit of learning curve, but it's 100% worth it!

You Can Automate Many Tasks

You can do things like create 1,000 files all with unique names using a single command. Doing this with the GUI would take ages.

It's Available Everywhere

The commands you'll learn will run on Linux & Mac machines out of the box, but with a little work they will also run on Windows!

It's Basically A Requirement

Whether you plan on becoming a web developer, data scientist, devops engineer, system admin, security admin, machine learning engineer, etc. you will NEED to use the command line.

Needed For Cloud Computing!

Most cloud services are operated via a command line interface. If you plan on running any projects in the cloud or using cloud resources, you'll need command line skills.

High Paying Jobs!

I always feel scummy talking about this, but of course it's important to highlight!
